

In this homework, you will use a finite-differences modeling code, similar to the one you wrote in the preceding homework, to implement basic reverse time migration. I do not expect you to be concerned with the efficiency of your implementation at this time. This implementation of reverse-time migration does not require that you write any new C code. You will use pre-existing Madagascar programs, but you will modify the *SConstruct* file to combine those programs.

This is an individual assignment and absolutely no collaboration on code is allowed.

Figure 1: Velocity.

Figure 2: Density.

Figure 3: Data w/ direct arrival.

EXERCISE

Using the finite-differences modeling function *awefd*, construct an image of the subsurface. This function takes the following parameters:

Figure 4: Data w/o direct arrival.

```
awefd(odat, owfl, idat, velo, dens, sou, rec, custom, par)
```

- `odat`: output data $d(x, t)$
- `owfl`: output wavefield $u(z, x, t)$
- `idat`: input data (wavelet)
- `velo`: velocity model $v(z, x)$
- `dens`: density model $\rho(z, x)$
- `sou`: source coordinates
- `rec`: receiver coordinates
- `custom`: custom parameters
- `par`: parameter dictionary

Design an imaging procedure following the generic scheme developed in class. Your task is to identify Madagascar programs necessary to implement reverse-time migration in two different ways and generate the appropriate `Flows` in the `SConstruct`. Explain in detail how your imaging procedures work.

1. Use your imaging procedure to generate images based on recorded data in Figures 3 and 4. For this exercise, use the constant density `rb.rsfs` for imaging. Include those two images in this document. Are the images different from each-other? How? Why?

Figure 5: Image migrated with the recorded data in Figure 3 and the constant density `rb.rsfs`.

Figure 6: Image migrated with the recorded data in Figure 4 and the constant density `rb.rsfs`.

2. Use your imaging procedure to generate images based on recorded data in Figures 3 and 4. For this exercise, use the variable density `ra.rsfs` for imaging. Include those two images in this document. Are the images different from each-other? How? Why? How do your images compare with the ones from the preceding exercise?

Figure 7: Image migrated with the recorded data in Figure 3 and the variable density `ra.rsfs`.

Figure 8: Image migrated with the recorded data in Figure 4 and the variable density `ra.rsfs`.

WRAP-UP

After you are satisfied that your document looks ok, print it from the PDF viewer and bring it to class.

SCONSTRUCT

```
